

VERA

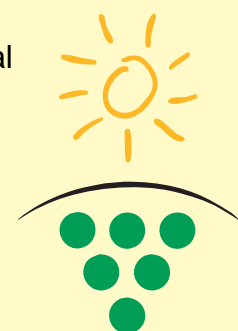

P R O D U C T S H E E T

The Viticare Environmental Risk Assessment Tool otherwise known as **VERA** has been designed by the CRCV to provide Australian viticulturalists with a straightforward way of beginning to incorporate environmental management into their broader vineyard management strategies.

The **VERA** tool guides growers through a list of questions about their vineyard management practices and helps them to prioritise issues and encourages them to think about how existing or potential problems can be addressed.

VERA is an entry-level tool and will provide many growers with an adequate knowledge of environmental management. The **VERA** tool has also been designed to provide a foundation on which to build towards development of a full environmental management system (EMS).

VERA is delivered to industry via a workshop format (paper-based and/or CD-ROM) and is available to those who have attended CRCV Environmental Management workshops. Others who have previous environmental management experience may also find the **VERA** tool useful.
